Hazard Communication Policy

Associated Students, Incorporated (ASI) shall implement a continuing, systematic program to communicate, evaluate, control and record the degree of employee exposure to hazardous chemicals and physical agents both regulated and non-regulated. Physical agents can take on different physical forms such as liquids, solids, gases, vapors, fumes and mists whether they are contained or not. The hazardous nature of agents and the potential for exposure are the factors that determine whether an agent is regulated or non-regulated.

Hazard Communication Summary

ASI has developed a hazard communication program to enhance employee health and safety. The program applies to hazardous agents regulated by legal health standards, and is designed to control exposure at or below the permissible exposure limits prescribed by federal or state regulations and to meet other provisions of such standards.

The program requires the identification, assessment and control of exposures to hazardous chemical and physical agents which employees may experience under normal operating conditions and under planned maintenance and shut-downs. Potential exposures from which employees can be protected through the use of personal protective equipment will also be identified, assessed and documented. Information derived from the assessment shall be documented in a form that complies with legal requirements and provides the information required to support a comprehensive occupational health program for employees.

The program will include the following elements:

- Identification of hazardous chemical and physical agents by work area
- Employee exposure assessment
- Control of unacceptable exposures
- Training and information
- Documentation and record keeping

Hazard Communication Objective

The program's primary objective is to ensure that no employee suffers adverse health effects that result from occupational exposures to hazardous chemical and physical agents. As a company, we intend to provide information about chemical hazards, hazardous substances, and their control. This includes Container Labeling, Material/Safety Data Sheets (M/SDS), and Training.

The following outlines how we will accomplish our objective.

Container Labeling

This responsibility has been assigned to all managers and supervisors.

No container of hazardous substance will be released for use or storage until the following labeling information is verified:

- Container contents clearly identified
- Appropriate hazard warnings
- Manufacturer's name and address

Secondary containers will be labeled to further ensure that employees are aware of hazardous materials used in their work areas.

Each supervisor will ensure that all secondary containers are labeled with either a copy of the original manufacturer's label or with generic labels which have blocks for the identity and the hazard warning.

Material/Safety Data Sheets (M/SDS)

M/SDS for hazardous substances present in the workplace are located in the respective manager's and/or supervisor's office. The department managers /supervisors will provide the Employee Training / Safety Coordinator with current M/SDS's. The Safety Coordinator and department supervisors will review incoming Material /Safety Data Sheets for new and significant health/safety information. They will ensure that any new information is passed on to the appropriate departments. M/SDS are available to employees for review during each work shift. If an M/SDS is not available or a new hazardous substance in use does not have an M/SDS, contact your supervisor immediately.

M/SDS will be reviewed for completeness by the Employee Training / Safety Coordinator. A new M/SDS will be requested from the manufacturer if an M/SDS is missing or obviously incomplete. The California Director of Industrial Relations will be notified if an M/SDS is not received on a timely basis, as dictated in Title 8, Section 5194.

Training and Employee Information

Employees will attend a New Hire Orientation and safety orientation prior to starting work.

This will include information and training on the following:

- Operations in work areas where hazardous substances are present
- Location and availability of the written hazardous communication program
- Physical and health effects of the hazardous substances
- Methods and observation techniques used to determine the presence or release of hazardous substances
- How to lessen or prevent exposure to these hazardous substances through controlled work practices and personal protective equipment
- Steps the company has taken to lessen or prevent overexposure to these substances
- Emergency and first aid procedures to follow if employees are exposed to hazardous substances
- How to read labels and review an M/SDS to obtain appropriate information

When new hazardous chemical is introduced in the work area, each supervisor will review the above items regarding the new material in a safety meeting.

Hazardous Non-Routine Tasks

Prior to starting work on hazardous non-routine tasks, each affected employee will be given information by their immediate supervisor about the task's hazards and potential exposures. This information will include measures already taken to lessen the hazards including ventilation, use of respirators, presence of another employee, and established emergency procedures.

Informing Contractors

It is the responsibility of the Employee Training /Safety Coordinator to provide contractors the following information:

- Hazardous substances to which they may be exposed while on the jobsite.
- Appropriate protective measures their employees should take to lessen the possibility of exposure.

General

If anyone has questions about this plan, contact any member of Management. Our plan will be monitored by the Employee Training/ Safety Coordinator to ensure that the policies are carried out and that the plan is effective.

LIST OF HAZARDOUS SUBSTANCES

Attached is a list of known hazardous or potential hazardous substances present. **See Attached**

Specific information on each noted hazardous substance can be obtained by reviewing the Material/Safety Data Sheets.

A complete list of hazardous substances is located in Attachment 1.

EMPLOYEE TRAINING PROGRAM

Our employees' training program has been developed on the basis of types of hazardous substances harmful to employees and/or the environment, and the common hazards associated with them. For specific hazard information on each type of substance, review the Material /Safety Data Sheet (M/SDS).

Overview of the Hazard Communication Regulation

The Hazard Communication Regulation is intended to ensure that both employers and employees are aware of the dangers associated with hazardous substances in their work areas. The following is a review of the specific requirements of the hazard communication program, including Container Labeling, M/SDS and Training.

Written Hazard Communication Program

This program outlines how we will provide information and control your exposure to hazardous substances. This plan is available for review during our training and in the Safety Coordinator's office for your review during your work shift.

Hazardous Substances Used In Our Workplace

We use and store a variety of products. Some of these contain one or more hazardous substances. Review the Hazardous Substance Inventory list in the Hazard Communication Program or in the Employee Training /Safety Coordinator's office.

READING LABELS AND MATERIAL/SAFETY DATA SHEETS (M/SDS)

Labels

A product label on both the original and secondary containers must be reviewed prior to working with the material.

Each label will have two important pieces of information:

- Hazardous Substances (Identity)
- Hazard Warnings

The label on the original container will also state the name and address of the manufacturer.

The label is a visual reminder of the information we have presented in the training session and of the information found in more detail in the M/SDS.

It is essential for your safety that you read the hazard warning and only use the hazardous substances as recommended on the label. Questions concerning the label should be directed to your immediate supervisor.

Material/Safety Data Sheets (M/SDS)

The M/SDS is the primary means to convey the necessary information about the hazards of substances we use and/or store. The manufacturer or store must provide us with adequate information to use and/or store the substance safely, and they are responsible for providing us with the M/SDS.

PHYSICAL AND HEALTH HAZARD OF THE HAZARDOUS SUBSTANCES USED

Employees will be trained about the hazards of the substances in their work areas. This may be done by specific hazardous substances or by categories of hazards. We will use the category approach, and each employee will be made aware that information is available on the specific hazards of individual hazardous substances through M/SDS.

The training will include the following:

- Measures to protect employees from the hazards
- Work practices

- Engineering controls
- Personal protective equipment use
- Physical and health hazard of the hazardous substance
- Detection of the substance release
- Emergency and first aid procedures

HAZARDOUS SUBSTANCES TRAINING GUIDE

Preparation

Before conducting a training program with employees on hazardous materials in the workplace, the instructor must prepare thoroughly for the session.

At a minimum, instructors should do the following:

- Read this outline and each M/SDS to be discussed. A guide to understanding M/SDS and a glossary of common terms used in M/SDS are provided at the end of the outline.
- Review the employees' work area and observe what engineering controls, protective equipment, safe work practices, and exposure monitoring are in effect, and whether any additional measures may be needed. These are the most frequent issues employees ask about during training. In some cases, the substances that will be discussed are used infrequently or are in such small quantities that over exposure risk is small to non-existent. Familiarity with the workplace will help the trainer focus on substances and situations that warrant the most attention.
- Make enough copies of M/SDS to hand out to each participant.
- Review any past exposure monitoring data available for the hazardous substances that will be discussed. Be prepared to summarize the results of such monitoring and compare them to applicable standards (permissible exposure levels).

Discussion Outline: M/SDS Training

The following outline is a guide for instructors. It can be tailored to suit individual needs or style.

A. WELCOME PARTICIPANTS TO THE SESSION, EXPLAIN WHAT AN M/SDS IS, AND THEIR RIGHT TO INFORMATION

"Today we are going to discuss the hazards associated with some of the substances we work with. I will be using a Material/Safety Data Sheet or M/SDS on each substance to help with this. An M/SDS has typically sixteen sections and will usually follow the following format: Section 1 – Product Identification and Manufacturer's Identification. Section 2 – Information on Ingredients. Section 3 – Hazards Identification. Section 4 – First Aid Measures. Section 5 – Fire Fighting Measures. Section 6 – Accidental Release Measures. Section 7 – Handling And Storage. Section 8 – Exposure Controls/Personal Protection. Section 9 – Physical and Chemical Properties. Section 10 – Stability And Reactivity. Section 11 – Toxicology Information. Section 12 - Ecological Considerations. Section 13 – Disposal Consideration. Section 14 – Transport Information. Section 15 – Regulatory And Other Information. Section 16 – Other Information

"Under the OSHA Hazard Communication Regulation, you have the right to review M/SDS for hazardous substances to which you may be exposed. Other provisions in the Cal/OSHA regulations extend this right to your physician. One copy also will be provided to you upon request. To obtain copies or other information about hazardous substances in your workplace, ask your supervisor. Our hazard communication plan and copies of the

regulation are available in the Employee Training/ Safety Coordinator's office. You have the legal right to this information; you will not be discriminated against for asking for it."

B. FOR EACH SUBSTANCE OR MIXTURE THE EMPLOYEE MAY BE EXPOSED TO, DESCRIBE EACH SECTION ON THE M/SDS.

"Let's now discuss (common name of material), a substance we use in (name of area or operation where material is used). This material is also known as (information from M/SDS). Health hazard information on this substance indicates that it can (information from M/SDS). Its hazardous ingredients are (information from M/SDS). Fire and explosion data indicates that the (information from M/SDS).

The M/SDS indicates that following protective equipment practices or special precautions should be taken (information from M/SDS). With regard to our use of this material, we ask that you (follow protective equipment requirements or work practices when handling this substance). Over-exposures are prevented by (engineering controls that are in place, or the small quantity of the material present). We (do/do not) routinely monitor exposure levels for this material. The results indicate that levels are within the OSHA standard permissible exposure levels for this substance (if true). You can detect the presence of this substance in the workplace by (indicate odor or other warning properties).

I will now discuss reactivity and physical data on the substance (continue discussion until participants understand this potential hazard). In case of emergencies like spills, fires or exposures requiring first aid, the following procedures should be followed (give appropriate information from M/SDS)."

C. REPEAT "B" FOR EACH MATERIAL ON THE LIST.

Note: Some M/SDS will have certain sections marked not applicable.

You may omit these sections in your discussion.

Ask for questions at the end of each substance discussion.

If you cannot answer the employee's question, indicate that you will get back to him/her and answer the question after further study or consultation.

Discussion Outline: Introduction to Toxicology and Chemical Hazard Concepts

The following information is presented to suggest ideas to the trainer in providing a general explanation of some toxicology and chemical hazard concepts which are necessary to employee understanding of M/SDS information.

A. WHAT ARE HAZARDOUS SUBSTANCES?

Hazardous substances are chemicals which have been identified as requiring special precautions during their use due to their toxic effects, physical properties like flammability, explosivity and reactivity or potential to adversely affect the environment,. The Hazard Communication Regulation is specifically concerned with potential hazards to workers. The hazardous types of materials most often encountered in workplaces are acids, bases, solvents, dusts, fumes, mists, gases, fuels, smokes, oils and radioactive isotopes.

B. WHAT DOES THE TERM "TOXIC" MEAN?

While the hazard presented by a flammable liquid may be well understood, the concept of toxicity of a substance requires explanation. Simply stated, toxic means poisonous. But understand that all chemicals,

including common table salt and sugar are toxic if consumed in large enough quantities. Therefore, the term toxic must be viewed as (1) how toxic the substance is, and (2) how much has been absorbed by the body. For example, for a highly toxic substance to cause harm, a very little dose or exposure is necessary; for a less toxic substance, a much larger dose or exposure would be necessary to cause harm. Medical experts have reviewed the data on many hazardous substances to determine how toxic they are and to set permissible exposure levels (OSHA standards) called PELs to limit the dose that workers receive of these substances. These standards are included on M/SDS and are used to evaluate workplace exposure monitoring results. Other factors discussed below are important to understanding how hazardous substances may result in a toxic effect.

C. HOW DO HAZARDOUS SUBSTANCES ENTER THE BODY?

There are three common routes of entry for hazardous substances to enter the body: inhalation, absorption and ingestion.

INHALATION

When breathed, gases, vapors, mists, dusts and fumes can either harm the lungs directly or can be absorbed into the bloodstream and affect other body organs. Because inhalation is the most common and potentially harmful type of exposure, nearly all PELs refer to airborne concentrations of toxic substances.

ABSORPTION

Substances that come into contact with the skin or eyes can either injure directly (for example, an acid burn) or be absorbed into the bloodstream through the intact skin. The M/SDS will indicate if skin absorption or direct injury may occur with the substance in question.

INGESTION

Except for cases where highly toxic materials are ingested due to improper personal hygiene practices, such as eating or smoking without first washing highly toxic substances from the hands, ingestion is not a common route of occupational exposure.

D. WHAT ARE THE TYPES OF TOXIC EFFECTS?

In general, there are two major types of toxic effects: acute and chronic.

ACUTE

Acute effects are observed when the exposure is sufficiently large to have an immediate and usually short-term effect. Examples of acute toxicity are chemical skin burns, asphyxiation, and sudden poisonings. In most cases, once recovery from the immediate harm occurs, there is no lasting effect.

CHRONIC

Chronic effects occur after repeated exposures over a long period of time, and may be associated with relatively low-level exposures. The injury may be slight, for example, skin irritation, or it may involve severe damage to organs and systems, such as lung disease, cancer, or impaired reproductive function. It is in this area of less obvious occupational hazards that the Hazard Communication Regulation and M/SDS will make a significant contribution by improving recognition of potential workplace hazards.

E. HOW ARE WORKERS PROTECTED FROM HAZARDOUS SUBSTANCES?

Despite the previous information on the potential hazards of substances used in workplaces, it is important to understand that effective measures exist to prevent or reduce worker exposures. If the measures are followed, none of these effects should occur.

ENGINEERING CONTROLS

Ventilation systems and physical isolation of the chemical from the worker are examples of engineering controls that are the surest means of controlling exposures to hazardous substances.

PERSONAL PROTECTIVE EQUIPMENT (PPE)

Respirators and impervious gloves are examples of personal protective equipment that reduce a worker's personal exposure to hazardous substances, but that do not improve the overall workplace environment. Use of personal protective equipment is covered by OSHA State and Federal regulation in many cases to assure that effective protection is afforded. PPE does not remove the hazard but only creates a barrier against it.

SAFE WORK PRACTICES

Certain practices over which workers have personal control, for example how fast a machine operates or how ingredients are added to a mixing vessel, can significantly affect exposure. Employees should be carefully trained to recognize this fact and work according to prescribed procedures.

ADMINISTRATIVE CONTROLS

Substitution of less hazardous materials, providing rest periods, and rotating employees where appropriate, are examples of reducing exposures through administrative controls. Management should use information provided in M/SDS to determine whether administrative controls can be used to further protect employees from hazardous substances.

PERSONAL HYGIENE

Measures as simple as washing hands before eating or showering at the end of a work shift can significantly reduce the overall exposure to hazardous substances. Personal hygiene is particularly important when handling highly toxic substances. OSHA regulations for certain substances prescribe personal hygiene practices.

FOLLOWING LABEL WARNINGS

Labeling, as required by the Hazard Communication Regulation, is an important control measure, if workers read, understand, and follow label instructions. Compliance with label instructions is an essential component of worker training under the regulation. Make sure that when workers see the words "danger", "warning" or "caution", that they know what the words mean and what they should do.

CONTRACTOR'S NOTIFICATION

As is required by CAL/OSHA through the Hazard Communication Statute (5194), the following is to serve as notification to contractors and their employees of the hazardous substances on-site. Contractors and their employees are to understand that these substances are being used or stored at this facility. Material /Safety Data Sheets (M/SDS) are available. For additional information, please contact the Safety Coordinator.

Our company has a formal, written Hazard Communication Program. We have procedures for handling hazardous substances. Please contact the Safety Coordinator for this information.

It is the responsibility of the contractor to make sure their employees comply with the requirements of our hazard communication program. It is the responsibility of the contractor to translate all of this information to their employees, if it should be necessary.

The contractor must read this information to any employees who cannot read it to themselves. Further, it is the responsibility of the contractor to provide any required personal protective equipment.

It is the responsibility of the contractor and their employees to ask about equipment requirements when arriving or returning to our premises, and to wear personal protective equipment.

It is the responsibility of the contractor and their employees to inquire about and follow all published safety rules in force at our company and for the specific department(s) in which they will be working or training. A set of such safety rules is available, upon request. As part of our insurance requirements, the contractor must make ASI an additional insured on the contractor's insurance and will provide appropriate certificates of insurance to ASI upon request.

Contractor's compliance to the above terms is a material condition of any contract with ASI and any continued business with ASI.
